

NNSA Need:

Plutonium Pit Production for Nuclear Deterrent

Solution:

Re-purpose existing structure

- Qualified structure
- Fabrication space
- Supporting facilities
- Construction facilities

Fire Protection

Security

Emergency Response

Anticipated Operations:

2,100 Highly-skilled personnel

Local and regional university and tech school collaborations to expand training programs

Plutonium Pit Production at SRS

A plutonium pit is a critical component of every nuclear weapon, but the United States' current capability to produce plutonium pits is limited. The National Nuclear Security Administration (NNSA), under Federal law and to meet national security requirements, must implement a strategy to provide the enduring capability and capacity to produce no fewer than 80 war reserve (WR) plutonium pits per year (ppy).

In 2018, the Nuclear Weapons Council endorsed NNSA's approach for supplying plutonium pits to meet stockpile requirements: a two-site strategy with Savannah River Site (SRS) producing no fewer than 50 WR ppy and Los Alamos National Laboratory (LANL) producing no fewer than 30 WR ppy. This approach will provide an effective, responsive and resilient nuclear weapons infrastructure with the flexibility to adapt to shifting requirements and counter future threats.

Two-Site Strategy

Studies of NNSA's approach show that having two geographically separated plutonium pit production facilities supports resiliency and redundancy from external threats and hazards. This provides NNSA with the flexibility and resilience to mitigate shutdowns, incidents or other impacts to operations at a given site.

Savannah River Plutonium Processing Facility (SRPPF)

SRS is achieving its part of this objective by constructing the Savannah River Plutonium Processing Facility (SRPPF) through repurposing the unfinished Mixed Oxide (MOX) Fuel Fabrication Facility, Building 226-F. Repurposing this facility allows NNSA to make use of an existing seismically-qualified structure, with numerous supporting facilities, including office; assembly and fabrication space; construction facilities; and existing SRS services and infrastructure, such as security, fire protection and emergency response.

U.S. DEPARTMENT of ENERGY

The Savannah River Site is owned by the U.S. Department of Energy. Savannah River Nuclear Solutions is the management and operations contractor at the Savannah River Site. Savannah River Mission Completion is the current liquid waste contractor at the Savannah River Site.

Pit Production Operations and Programs

The NNSA has also established the Savannah River Pit Production Operations and Programs (PPOP) organization to design and develop pit production processes and products, and develop training and procedures for ongoing competency in pit production, prior to SRPPF project completion and startup. The PPOP organization will operate SRPPF for a minimum of 50 years once facility operations are authorized.

The resulting SRPPF process will make use of SRS' core competencies in operations, safety and security. The process to produce pits at SRPPF will begin with the receipt of specific plutonium reserves held by the NNSA. The plutonium will be prepared by removing impurities that have accumulated through radioactive decay. The plutonium will then be formed into machinable components. The components will be assembled into the final pit, inspected and accepted by NNSA.

Upon reaching steady-state operations, it is expected that the SRPPF will require approximately 2,100 employees. This will include highly-skilled employees to perform machining, welding and testing of plutonium parts. SRS is working with local and regional

The Pit Production Operations and Programs organization will operate SRPPF for a minimum of **50 years** once facility operations are authorized.

technical schools and universities, including institutions that serve underprepared or under-resourced students, to expand training programs and establish a technical and personnel pipeline.

The SRPPF design includes an on-site High-Fidelity Training and Operations Center (HFTOC) to support the project and accelerate the workforce pipeline as construction continues. The HFTOC will be used to train personnel, develop operator proficiency and provide hands-on experience with non-radioactive materials.

Additional training programs include a Knowledge Transfer Program and Mutual Support Program, which were developed in partnership with LANL and are being expanded to include other facilities within the Nuclear Security Enterprise, to share knowledge and lessons learned between sites, as they work to accelerate the shared mission.

SRPPF Main Process Building (MPB)

Building 226-F, also known as the SRPPF Main Process Building (MPB), was designed to meet high safety and security standards, with exterior walls and roofs engineered and constructed to resist all credible manmade and natural phenomena hazards. The facility has more than 400,000 square feet of available Hazard Category-2 space, which will meet the pit production requirements.

Repurposing the MPB requires modifications and installation of manufacturing and support equipment directly associated with the pit production mission. Preparations at SRS will also include removing some existing facilities, along with adding new support facilities and modifying some existing ones.

SRPPF Project – Design and Construction

With the 2018 announcement, engineers at SRS began working on a conceptual design for the SRPPF. In June 2021, NNSA announced that SRPPF had received Critical Decision 1 approval. This decision marks the completion of the project definition phase and approves the conceptual design. Additionally, it authorizes SRS to proceed in maturing the design and refining cost and schedule ranges to establish a project performance baseline.

To develop the design and manage the construction for this complex facility, NNSA is utilizing the SRS Management and Operations contractor Savannah River Nuclear Solutions (SRNS) in partnership with a Construction Management (CM) contractor experienced in executing mega projects. SRNS awarded Fluor Federal Services the SRPPF CM subcontract in 2023. SRNS completed transfer of Engineering, Procurement and Construction responsibilities to Fluor in 2024. Fluor is utilizing its full suite of systems and tools to lead activities, while SRNS provides oversight and support.

The project team also includes staff from multiple national laboratories and two external engineering firms. Working closely with LANL, this team is developing a design built on plutonium pit production technologies that have been refined and improved over the past three decades.

The team members' roles in the design of the SRPPF include:

- NNSA Project, Contract and Technical authorities provide administration, direction and oversight.
- SRNS is responsible for the overall project management, design integration, design authority, nuclear safety and criticality safety.
- Fluor Corporation is designing the balance-of-plant systems for the production process, such as electrical, plumbing and ventilation.
- Merrick and Company, an external firm that has assisted LANL with the design of their plutonium confinement systems (gloveboxes), is providing the same service for the SRPPF.
- The Physical Security Center of Excellence (PSCOE) at Sandia National Laboratories is designing the Perimeter Intrusion Detection and Assessment System (PIDAS).

In October 2022, SRNS entered into a Project Labor Agreement with the Augusta Building and Construction Trades Council, which is comprised of 19 local unions. The agreement is in support of construction of the SRPPF, as there are approximately 4,000 construction and trade union jobs to fill for the entire project.

Record of Decision

The SRPPF project is subject to the National Environmental Policy Act (NEPA), part of which requires potential environmental impacts be considered before a government agency decides to undertake an action. A detailed Environmental Impact Statement (EIS) for SRPPF was prepared for public comment in April 2020, and the Final EIS was published in October 2020. In November 2020, the Record of Decision announcing NNSA's decision to implement the Proposed Action to repurpose Building 226-F to produce WR pits was published. On May 9, 2025, the NNSA announced its intent to initiate a NEPA programmatic environmental impact statement (PEIS) process to ensure NEPA compliance for the production of plutonium pits at the Congressionally mandated rate using various single site and multi-site alternatives; associated activities at other NNSA sites; and associated waste management and transportation activities.
